                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                          and/or diabetes related genes and their corresponding proteins. The invention also relates to compositions, reagents, kits and methods for diabetes, more treating obesity and/or diabetes. The composition and methods are useful for diagnosing, monitoring and treating obesity and/or diabetes. These may also be used in drug screening purposes and in gene therapy. The present sequence is the human shrelin (GHRL) variant protein. This protein is encoded by an obesity and diabetes related gene.

The present invention relates to a method of screening animals to determine those more likely to produce desired growth, appetite and fatness which involves obtaining a sample of genetic material from the animal and assaying for the presence of a genotype in the animal which is associated with favourable growth, appetite and fatness, the genotype characterised by a polymorphism in the ghrelin gene. The composition and methods are useful in screening animals (i.e. pigs) to determine those more or less likely to produce desired growth, appetite and fatness to optimise breeding and selection techniques. The present sequence is human ghrelin protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GCCATGGCAGGCTCCAGCTTCCTGAGCCCTGAACACCAGAGAGTCCAGGTGAGACTCCC 120

The present sequence represents a protein designated Zsig33. The nucleic acids are strongly expressed in stomach tissue. The polypoptide (or allelic variants/orthologs) can be used to stimulate gastric motility, measured as increased transit time or gastric emptying of an ingested substance in mammals. The products are used to treat disorders associated with gastrointestinal cell contractility, secretion of digestive enzymes, gastrointestinal inflammation, reflux disease and nutrient carymes, gastrointestinal inflammation, reflux disease and nutrient carymes, gastrointestinal inflammation, reflux disease and nutrient carymes, gastrointestinal inflammation, reflux disease con nutrient carymes protein motilin belongs has been associated with neurological complexity and other metabolic disorders where neurological treat obesity and other metabolic disorders where neurological feedback modulates nutritional absorption. They are useful to identify zsig33 agonists, antagonists and ligands and to produce antibodies
                                                                                                                                                                                                                                                                                     Zsig33; gastric motility; gastrointestinal inflammation; reflux disease; nutrient absorption regulation; obesity; metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human polypeptide having homology to motilin, zsig33 - useful e.g. to treat gastrointestinal motility disorders, obesity etc. and to identify antagonists to treat gastrointestinal hypermotility.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method for identifying a cancer cell or tissue of the reproductive system by detecting expression of a ghrelin, an exonal deleted preproghrelin and/or a GHS-R lb proteins or nucleic acids. The antibodies, exon 3-deleted form of preproghrelin and antagonists are useful for treating cancer of the reproductive system such as prostate, ovarian, breast, cervical or uterine cancer, choriocarcinoma or benign prostatic hyperplasia. The present sequence is human exon 3-deleted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           121 CACAAAGCCCCACATGTTGTTCCAGCCCTGCCACTTAGCAACCAGCTCTGTGACCTGGAG 180

anticancer, anti-inflammatory, anticobial, nootropic, hepatotropic, neuroprotective, cardiovascular and antiasthmatic activities, and can be used in gene therapy. Hypps can be used to treat or prevent disorders associated with decreased activity or function of HSPP. Antagonists of HSPP are used to treat or prevent disorders associated with increased activity or function of HSPP. Such diseases include cell proliferation (including cancer), inflammation, cardiovascular, neurological, reproductive or developmental disorders (e.g. arteriosclerosis, cirrhosis, psoriasis, acquired immune deficiency syndrome, anaemia, cathma, Crohm's disease, microbial or other infections, congestive or ischaemic heart disease, Alzheimer's, Parkinson's or Huntington's diseases, solizophrenia, ovulatory defects, muscular dystrophy). HSPP chick diseases, solizophrenia, ovulatory defects, muscular dystrophy), detecting HSPP in stendard hybridisation and amplification assays (for detecting HSPP in stendard hybridisation and amplification assays (for diagnosis and monitoring), in gene therapy, as antisense, triplex-forming or ribozyme therapeutics, for detecting related sequences or genetic variations, and for chromosomal mapping, HSPP are also used to raise specific antibodies (Ab) and to screen for agonists and antagonists, in competitive drug screens, and for purification of HSPP from natural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 GCCATGGCAGGCTCCAGCTTCCTGAGCCCTGAACACCAGAGAGTCCAGGTGAGACCTCCC 120

                                                                                      ò
                                                                                                             셤
                                                                                                                                                                                The present sequence is that of zsig13, a secreted protein with homology to motilin (see AAB20102). Zsig13 is expressed at high levels in the small stomach, and at lower levels in the small intestine and pancreas. A novel peptide fragment of zsig13, termed SGIP (see AAB20100), is claimed. SGIP is a ligand for growth hormone secretagogue receptor, and is therefore useful for modulating secretion of growth hormone and insulin like growth factor 1. SGIP, and variant SGIP peptides, are used in claimed methods for stimulating contractability in duodenum or jejunum tissue, modulating pancreatic secretion of hormones and digestive enzymes, inducing growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GCCATGGCAGGCTCCAGCTTCCTGAGCCCTGAACACCAGAGAGTCCAGGTGAGACCTCCC 120

receptor complex that involves providing an immobilized receptor, and contacting the receptor with a zsig33 peptide (comprising residues 24-37 of AABGZ449), where the receptor binds to the zsig33 peptide. The method is useful for purifying cells purifying a peptide, stimulating signal transduction in a cell expressing a receptor. It is also useful for modulating secretion of hormones, neural development and/or utilization, compared in contractility, nutrient uptake, secretion of digestive and parcreatic enzymes and hormones, secretion of insulin-like growth factor or secretion of non-zsig33 proteins. It is useful for modulating growth hormone, such as osteoporosis, bone repair, bone remodeling, low osteoblast levels, cartilage repair and remodeling, cremodeling, iow osteoblast levels, cartilage repair and remodeling, skeletal dysplasia, immune suppression, obesity, growth retardation, grotein catabolic responses after surgery, cachexia, protein loss, darrism, wound healing and ovulation induction, treating a mammal having a metabolic disorder requiring neurological feedback, such as satiety regulation, glucose absorption and metabolism and neuropathy-associated

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressont and eyfoctatic activity. The polymocleotides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous such as ystem, such as peripheral nervous injuries, peripheral nervous disease, such as localised neuropathies and central nervous system disease, such as a lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity, chemotactic/chemokinetic activity, haemostatic cutilisation of the activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification

                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel peptide compound or its salt which induces the secretion of growth hormone and/or elevates calcium ion concentration in cells. The peptides are ghrelin homologues and are concentration in cells. The peptides are ghrelin homologues and are characterised in that at least one amino acid has been substituted by a modified amino acid and/or a non-amino acid compound. The invention also encompasses the unmodified peptides; the DNA encoding the peptides; vectors and host cells comprising such DNA, a method of producing the peptides comprising recombinant production, optionally followed by chemical modification; an antibody specific for a peptide of the invention; and an assay and kit for detecting the peptides of the invention are useful for treating and/or diagnosing diseases caused by a deficiency in growth hormone expression or activity. In particular, they are useful for promoting infant growth due to growth hormone deficiency. The compounds of the invention are safe with no accompanying side effects. The present sequence represents a ghrelin-type growth hormone secretagogue (GHS) precursor protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               121 CACAAAGCCCCACATGTTGTTCCAGCCCTGCCACTTAGCAACCAGCTCTGTGACCTGGAG 180

The present sequence represents human zsig33. The specification describes a short gastrointestinal peptide (SGIP), which is derived from zsig33. SGIP has homology to motilin. The SGIP peptide may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate SGIP expression. For example, SGIP may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of SGIP by expressing inactive proteins or to supplement the patients own production of SGIP SGIP and all assays to identify modulators of antibodies against SGIP and in assays to identify modulators of SGIP expression and activity. The anti-SGIP antibodies, agonists and antigonists may also be used to regulate expression and activity. The anti-SGIP antibodies may also be used to regulate expression and activity. The anti-SGIP antibodies may also be used as diagnostic agents for detecting the presence of SGIP in samples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New Short Gastrointestinal Peptide, which has homology to motilin, useful for preventing, diagnosing and treating gastrointestinal disorders.

uptake; growth hormones, secretion of digestric contractility, nutrient uptake; growth hormones, secretion of digestrive enzymes and hormones. The sequences of the invention are used in the prevention, diagnosis and treatment of diseases associated with inappropriate ZSIG33 expression. The nucleic acids of the invention and their complements are used as DNA probables in diagnosis cassays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The ZSIG33 peptides are used as antigens in need of restorative therapy. The ZSIG33 peptides are used as antigens in need of restorative therapy. The ZSIG33 peptides are used to down regulate expression and activity. The modulators of ZSIG33 expression and activity. The anti-ZSIG33 antibodies and also used as diagnostic agents for detecting the presence of ZSIG33 in samples (e.g. by enzyme linked immunosorbent assay (ELISA)). The peptides and nucleic acids of the invention are used to modulate gastric contractility, nutrient uptake, growth hormones, the conditate gastric contractility, nutrient uptake, growth hormones, the condition of digestive enzymes and hormones, and/or secretion of enzymes and/or hormones in the panoreas. ZSIG33-like peptide is used in protein therapy. The present sequence is home.

                                                                                                                                                                                                                                                                                                                              ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to zsig33-like peptides (ZS33LP) including zsig33-

linker, zsig33-beta, zsig33-gamma, zsig33-delta and zsig33-epsilon

peptides and nucleic acid molecules encoding such zsig33-like peptides.

ZS33LP peptides activate the immune system in boosting immunity because infectious diseases, treating immunocompromised patients such as human infectious diseases, treating immunocompromised patients and in treatment of bacterial, viral, protozoal and fungal infections. Peptides of the invention are used to identify and isolate receptors involved in growth regulation in the liver; blood vessel formation and other developmental processes. They are useful for evaluating functions of hypothalamus-pituitary-adrenal axis, to modulate growth and/or cyclerations containing glucose and as adsorption enhancers for oral drugs which require fast nutrient action and to stimulate glucose-induced insulin release. They are also useful as research reagents for the insulin release.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       expansion, differentiation, growth factor and hormone secretion and/or cell-cell interactions of tissues associated with gastrointestinal system, brain and central nervous system. These molecules are useful for treating dysfunction associated with contractile tissues or to suppress or enhance contractility in vivo and to treat gastrointestinal and growth related diseases. ZS33LP peptides, nucleic acids and/or antibodies are useful for treating disorders associated with gastrointestinal
                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polypeptides, useful for modulating gastric contractility, nutrient uptake, pancreatic secretion of hormones, digestive enzymes and treating gastrointestinal and growth related diseases, comprises zsig33-like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    contractility, secretion of digestive enzymes, hormone and acids, secretion of hormones in the pancreas and/or brain, gastrointestinal motility, recruitment of digestive enzymes, inflammation and regulation of nutrient absorption. Sequences of the invention are useful in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          therapy. The present sequence is human zsig33 protein

```
The invention describes an isolated human PRO polypeptide. The PRO polypeptides are useful in detecting PRO polypeptides in a sample, in complete a broadcaive molecule to a cell expressing a PRO polypeptide, and in modulating a bioactive molecule to a cell expressing a PRO in modulating at least one biological activity of a cell expressing a PRO converse broadcar and expressing a PRO polypeptide. PRO1312 stimulates hypertrophy of neonatal heart and is thus useful for treating cardiac insufficiency disorders. PRO154 and PRO186 conseculation of pro343, PRO828, PRO826, PRO826, PRO186 or PRO1360 and PRO1387 induce c-fcs in endothelial growth, and PRO136, CC PRO1360 and PRO1387 induce c-fcs in endothelial cells, and are thus useful for treating conditions or disorders where angiogenesis would be beneficial, e.g. wound healing and antagonist of this polypeptide are useful for treating cancerous tumours. PRO812 inhibits vascular conditions are accorders where angiogenesis would be conditionally accoliferation of colls and is thus useful for inhibiting endothelial cell growth in cells and is thus useful for inhibiting endothelial cell growth in colls and is thus useful for inhibiting endothelial cell growth in colls and is thus useful for inhibiting tumour growth. PRO826, PRO1068, PRO1068 or PRO1132 enhance survival/proliferation of stimulated T-lymphocytes and are therapeutically useful for renating retinal imminities, e.g. retinities plamentosum, AMD. PRO819, PRO813 and therefore associated with dermatitis, herpetiformis or Crohn's comphropathies associated with dermatitis, herpetiformis or Crohn's comphropathies associated with dermatitis, herpetiformis or crohn's colliferation and/or redifferentiation of chondrocytes in culture and are disease. PRO81310, PRO844, PRO8132, PRO8132, and arthritis. This is the amino acid sequence of a novel human PRO protein
                                                                                                                                                                                                                                                                                                                                                                                 J, Baker KP, Botstein D, Desnoyers L, Eaton DL;

FUNCTION: Obestatin is a specific ligand for the GPR39 receptor. It has an appetite-reducing effect, results in decreased food intake, and reduces gastric emptying activites and jejunal motility (By similarity).

SUBCELIULAR LOCATION: Secreted protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Kojima M., Hosoda H., Matsuo H., Kangawa K.;

synthesis in the stomach following gastrectomy.

The O-n-cotanoylation is essential for ghrelin activity. The O-n-decanoylated forms Ghrelin-27-C10 and Ghrelin-28-C10 differ in the length of the carbon backbone of the carboxylic acid bound to Ser-S. A small fraction of ghrelin, ghrelin-28-C10:1, may be modified with an unsaturated carboxylic acid.

PTM: Amidation of Leu-98 is essential for obestatin activity (By

"CDNA cloning of feline and caprine ghrelin.";

submitted (JUL-2002) to the EMBL/GenBank/DDBJ databases.

"LE WINCTION: Ghrelin is a specific ligand for the growth hormone control of the properties of growth hormone from the pituitary. Has an appetite-stimulating effect, induces adiposity and stimulates gastric acid secretion. Involved in growth regulation (By similarity).

"It has an appetite-reducing effect, results in decreased food intake, and reduces gastric emptying activites and jejunal motility (By similarity).

"cDNA cloning of felime and caprine ghrelin.";

Submitted (JUL-2002) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Ghrelin is a specific ligand for the growth hormone secretagogue receptor type 1 (GHSR) inducing the release of growth hormone from the pituitary. Has an appetite-stimulating effect, induces adiposity and stimulates gastric acid secretion. Involved in growth regulation (By similarity).

-!- FUNCTION: Obestatin is a specific ligand for the GPR39 receptor. It has an appetite-reducing effect, results in decreased food intake, and reduces gastric emptying activites and jejunal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       41 LysLysProSerGlyArgLeuLysProArgAlaLeuGluGlyGlnPheAspProAspVal

-!- PTM: O-n-octanoylation is essential for ghrelin activity (By similarity).
-!- PTM: Amidation of Leu-98 is essential for obestatin activity (By similarity).
-!- SIMILARITY: Belongs to the motilin family.

TISSUE SPECIFICTY: Ghrelin is broadly expressed with higher expression in the stomach. Very low levels are detected in the hypothalamus, heart, lung, pancreas, interestine and adipose tissue. Obestatin is most highly expressed in jejunum, and also found in duodenum, stomach, pituitary, ileum, liver, hypothalamus and heart. Expressed in low levels in pancreas, cerebellum, cerebrum, heart. Expressed in low levels in pancreas, cerebellum, cerebrum,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              hormone secretagogue receptor.";
Trends Endocrinol. Metab. 12:118-122(2001).
-!- FUNCTION! Ghrelin is a specific ligand for the growth hormone secretagogue receptor type 1 (GHSR) inducing the release of growth hormone from the pituitary. Has an appetite-stimulating effect, induces adiposity and stimulates gastric acid secretion. Involved in growth regulation.
-!- FUNCTION: Obestatin is a specific ligand for the GPR39 receptor. It has an appetite-reducing effect, results in decreased food intake, and reduces gastric emptying activites and jejunal
                                                                                                                                                                                                                                                                                                                                                               Hosoda H., Kojima M., Matsuo H., Kangawa K.;
